# Simple craters

# Contact and compression stage

- Most of projectile's energy, momentum transferred to target rocks
- $t_{cc} \approx 2R/v_i$
- Rankine-Hugoniot equations can be solved for pressure
- At few km/s, energy per unit mass  $\approx$  that of TNT

# Cinder Lake Crater Field, AZ

# The Sedan Test -- Plowshare Program

July 6, 1962

A thermonuclear device was lowered into the desert alluvium to a depth of 194m in Yucca Flat, NV.

The fusion-fission blast had a yield equivalent to 104 kilotons of TNT, and lifted a dome of earth 90m above the desert floor before it vented at 3s after detonation.

The explosion displaced more than 11,000,000 tons of soil, and the resulting crater is 100m deep with a diameter of about 390m. A circular area of the desert floor five miles across was obscured by fast-expanding dust clouds moving out horizontally from the base surge, similar to a pyroclastic surge. The blast caused seismic waves equivalent to an earthquake of 4.75 on the Richter scale.

# The Sedan Test

# Ejection/excavation stage

- *Rarefaction wave vaporizes/melts/fractures rocks*
- $t_{cf} \approx (D/g_p)^{1/2}$ 
  - ~10 s for Meteor crater
  - ~13 min for Mare Imbrium

# Collapse/modification stage

- Steep rim of *transient crater* collapses into interior
- $t \approx \text{few} \times (D/g_p)^{1/2}$
- Final depth  $d \approx 0.2D$
- Rim height  $h \approx 0.04D$
- Diameter  $D \approx 20R$
